The Goal: Absolute Activeness

One of the main issues in the State of Israel's present defense structure is that of active defense. No other country in the world faces the threat of missile and rocket attack as does Israel. Over the years, this fact has led to rapid development in different areas - from defense against medium-range missiles when Iraq and Syria were Israel's bitter foes, to expanding capabilities in the face of the Iranian threat. At present, a structure for the complete defense of Israel is being built consisting, inter alia, of Iron Dome, Arrow, David Sling, and other systems.

The challenge involved in Israel's active defense is to reach a detection and interception capability aimed at protecting the civilian population from any possible threat. In order to achieve this, vital systems must be optimally deployed and operated. It may thus be verified that each time Israel is faced with a ballistic threat, an appropriate solution is readily at hand.

Omnisys possesses highly significant niche capabilities that interface perfectly with the range of systems produced by the various industries.

These solutions enable the system planner, as well as its operators, to provide optimal defense of the country. Hence, the great importance of including Omnisys in all of the systems in which it takes part.

Omnisys provides unique, cutting edge solutions while acting out of ongoing commitment, attentiveness, understanding, impressive development capability and a high level of implementation. When a specific need arises, requiring a quick solution, Omnisys mobilizes in full force to provide stability and peace of mind, and achieve the expected results.

Arieh Herzog was Head of the IMDO (Israeli Missile Defense Organization) and responsible for the development of Israel's active defense projects during 2000-2012.
